1. Change last week's exercise 3 to open a file "*monthName####*.txt" (*where monthName is the name of the selected month, followed by the year ####*) into which it should print the month data (*instead of the standard output*).

example - file **October2005.txt**:

Mon	Tue	Wed	Thu	Fri	Sat	Sun
					1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30
31						

2. Expand the previous exercise to print the calendar not into a text file but into the table structure of an HTML file.
For an example HTML file please see:
http://programming.swordfighter.co.uk/cp2ex0405/ex0102table.html

3. Write a program called "myLog" which opens an ASCII text file "log.txt". Your program should then append this file with everything that is input from the standard input (*stdin*), i.e. the shell, until the EOF character combination (*Ctrl-D*) is pressed.
